Often in the network monitoring stack, diagnostics is overlooked. Typical network monitor programs focus on performance counters for some hardware items. Performance counters return CPU load percentages or hard drive temperatures. They don't return any data regarding any hardware faults or failures.

A different type of network monitoring program is required for this. With Windows the underlying subset enables us to return live and current hardware diagnostic status.

With remote working allowing staff to be located anywhere in the world this causes major issues for Managed Service Providers. Clearly access to distributed endpoints can be difficult. Sending out an engineer to employees homes can be time consuming and expensive.

Using a Console probe on each machine enables diagnostic data to be sent over HTTPS to a cloud server. Data is displayed in a web browser. All connected endpoints wherever they are in the world can return data. Diagnostic data on hardware components in the endpoint is returned.

Syvir - Service Diagnostics is a windows diagnostic monitor for MSPs' that scans for problems with hardware components.

Syvir - Service Diagnostics (SD) is a cloud based remote network hardware monitor for Managed Service Providers. SD is hosted by Syvir. We run the hosted server for you. A web interface provides monitoring and configuration.

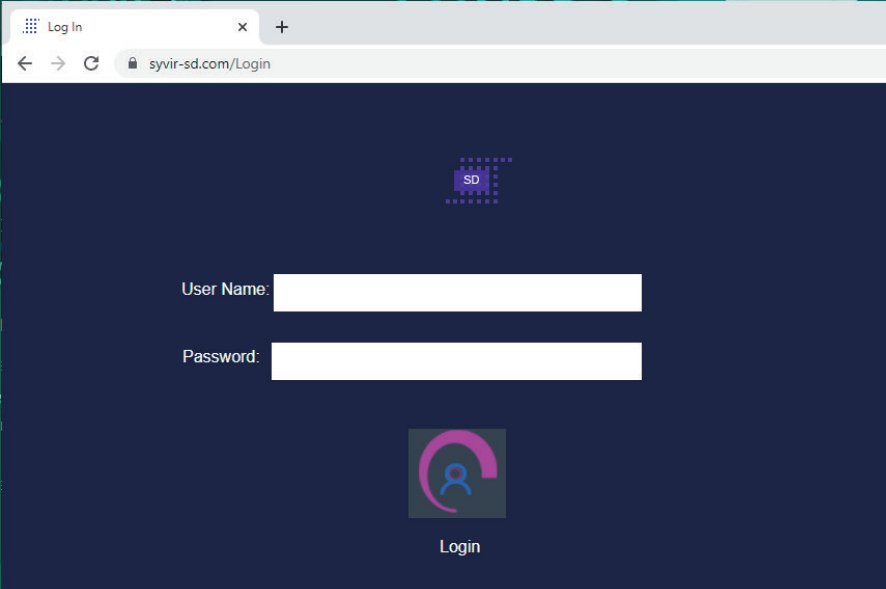

To create a hosted solution please visit www.syvir.com and start a free trial. Syvir automatically creates a local domain name for your instance of SD.

With your account you are assigned two usernames and passwords.

Make sure you agree to the privacy policy along with the terms and conditions.

Once you have signed up you will receive a welcome email. This contains your login information.

The site provides visual monitoring and reports of your clients endpoints. Enter your credentials and click Login, to log into Syvir - Service Diagnostics.

A screenshot of a web browser window showing the login page for Syvir SD. The browser's address bar displays 'syvir-sd.com/Login'. The page has a dark blue background. At the top center is a logo consisting of a square grid of dots with 'SD' in the middle. Below the logo are two white input fields: 'User Name:' and 'Password:'. At the bottom center is a circular icon with a stylized 'S' and a person silhouette, with the word 'Login' underneath it.

In this eBook we guide you with monitoring your clients network endpoints with Syvir - Service Diagnostics (SD) using our cloud based monitoring system.

To begin monitoring your clients systems you will need to download software to install on your clients machines. We advise if you are trying out SD for the first time on your network to try the service on one machine, so you can assess the capabilities of SD.

Once this process is complete run the software using the Probe@ account and password. Other account names will not work. Type in your clients code and select the endpoint type. A console probe will be created on the SYVIR SD cloud. Sensors are automatically created for the probe.

Each time the system is scanned, diagnostic data is uploaded to the syvir-sd cloud.

A console probe on each monitored endpoint, connects to the SD cloud server.

Diagnostic data is transferred to the cloud. Data is accessed through any device that supports a web browser.

The structure of SD.

Diagnostic data is gathered from the endpoint with WMI.
The sensors in the probe processes this data into channels and sets alarms if a problem is found.
Data is encrypted through SSL to the SD server.
Data is transferred through HTTPS and uses port 443
Data is stored and rendered through active server pages.

Probe

A console probe is a windows based service that connects to the SD server.
Each monitored endpoint has its own Probe. This is designated by the computer name.
We recommend that each monitored endpoint has it's own unique name, to avoid conflicts using SD.
The hierarchical structure of SD places the probe as the most powerful item in a endpoint deployment.

Sensors

The console probe contains Sensors that use WMI technology to monitor the current state of hardware.
Sensors are deployed to monitor hardware.
Sensors contain channels for multiple items i.e several drives etc.
Diagnostic data is received for each channel that's in use with a deployed sensor.

Channels

The sensor contains multiple channels.
For instance a USB sensor checks each usb port and assigns the port to a channel.

Properties

Diagnostic data is gathered from the endpoint with WMI.
The sensors in the probe processes this data into channels and sets alarms if an action is needed.
Data is transferred through HTTPS to the SD Cloud.
Data is stored and rendered through active server pages.

Install Console Probe

Each pc, server, virtual machine requires an installation process to create your machine probes profile and sensors, this will be where you enter your domain probe username, password and client code. These are not stored on the machine. Select the machine type you wish to scan. Four machine types are available

PC
Server
VMWare
Hyper-V

VMWare and Hyper-V deploy less sensors as quite a few are not detected.

In practice on Hyper-V and VMWare scans you can select PC or Server if you wish, but note you will get alot of Sensors, set to Not Detected.

WMI services need to be running on each machine you wish to monitor with SYVIR SD.

Please note the account you use to monitor with WMI only requires Read permission.
Do not enable Read/Write or Write this may leave the machine open to viruses etc.

The Console Probe transfers non-identifiable data through HTTPS to the SD cloud.
Once the Probe Console is installed please run this.

Type in your username password and client code.
For the console you need to use probe@company other logins will not work!

Select the type of endpoint.
The monitoring is now setup for this machine.
Repeat this process for each machine you wish to monitor.

Console Probe

Before scanning a clients endpoint ensure you have setup a client code for this customer.

Once this process is complete run the software using the Probe@ account and password. Other account names will not work.

Run the software in Administrator mode..or it will not provide reliable scan results...

A console probe will be created on the SYVIR SD cloud. Sensors are automatically created for the probe.

To scan the system for diagnostic issues.

1.Click on the Start icon.

2.Click on the Scan button.

The system is scanned and diagnostic data is uploaded to the syvir sd cloud.

To view the data make a note of the console probe name this will be the name of the virtual machine.

In your browser visit www.syvir-sd.com

SYVIR SD is specially designed for MSPs' to check their client customers endpoints for faults.

Clients are added in the Add Client page.

To add a new client type in the clients name into the Client box. Add a unique code for the client code.

The client code is used to separate different customers endpoints. This enables a customers endpoints to be grouped together and avoid probe console name clashes. Once you have entered these click on add.

To view a list of clients select the Client page.

To delete clients from the system click on the Delete button then click on OK. This deletes the client from SYVIR SD.

To save a list in .csv file click on the download icon.

Reports

A wide range of reports are available in csv file format for use in a spreadsheet.

The directory box on the left contains all your msp clients click on a client name. On the left hand directory box is a list of that clients console probes.

With some reports you need to select a client first.

All data for that clients console probes will be downloaded.

Some reports require the console probe to be selected so individual reports on specific console probes can be made.

These are the reports produced by SYVIR SD

Sensors on the selected client console probe, that are UP.

Sensors on the selected client console probe, that are set to WARNING.

Sensors on the selected client console probe, that are DOWN.

All Console Probes and Sensors on the selected client, that are UP.

All Console Probes and Sensors on the selected client, that are set to WARNING.

All Console Probes and Sensors on the selected client, that are DOWN.

Diagnostics for the selected Client Console Probes sensors.

Sensors on the selected client console probe, that are set to UP, WARNING and DOWN.

All Console Probes and Sensors on the selected client, that are set to UP, WARNING and DOWN.

Diagnostics for the selected Client Console Probes alarm.

Alarms on the selected client console probe.

Alarms on all client console probes.

Domain

Each MSP/company is assigned a local domain. @domain. In the domain we have two different account types which are assigned roles.

Each account type has different objectives and usage requirements for particular types of users.

Administrator

The administrator account and role has the user name of admin. The admin account is typically held by the account owner. This account gives you access to the control panel and dashboard.

Probe

The probe account is used to authorize a local probe to authenticate the transfer of diagnostic data to the SD server. A probe account only works with a console probe.

Control Panel

The Control Panel is accessed through the Dashboard page. Control Panel provides information on various aspects of the SD server. The administrator account has sole access to the control panel.

View the current status of the Syvir - Service Diagnostics cloud.

Here we provide details of any service issues with the SD cloud.

Raise a support ticket.

On occasions you may have need to contact us with a query with the Syvir - Service Diagnostics cloud. You can send us a message using the web based form. We will get back to you within 24 hours concerning your query.

View your subscription plan.

This details the subscription package you have subscribed to.

Roles and user credentials.

SD uses Roles and user credentials to determine the access that user accounts have to the SD server. The administrator account and role has the user name of admin. The admin account is typically held by the account owner. This account gives you access to the control panel and dashboard.

The probe account is used to authorize a local probe to authenticate the transfer of diagnostic data to the SD Cloud.

Check the number of probes deployed on your computers.

This number indicates how many probes you have installed on your network computers.

Probe Setup

Install and setup a probe on a windows endpoint.

Cooling

BTOS

CPU

Email setup

Specify email addresses to get diagnostic reports.

Terms of Service

View the Syvir - Service Diagnostics. Terms of Service.

Download and install software

Install instructions for using Syvir - Service Diagnostics software.

Timezone

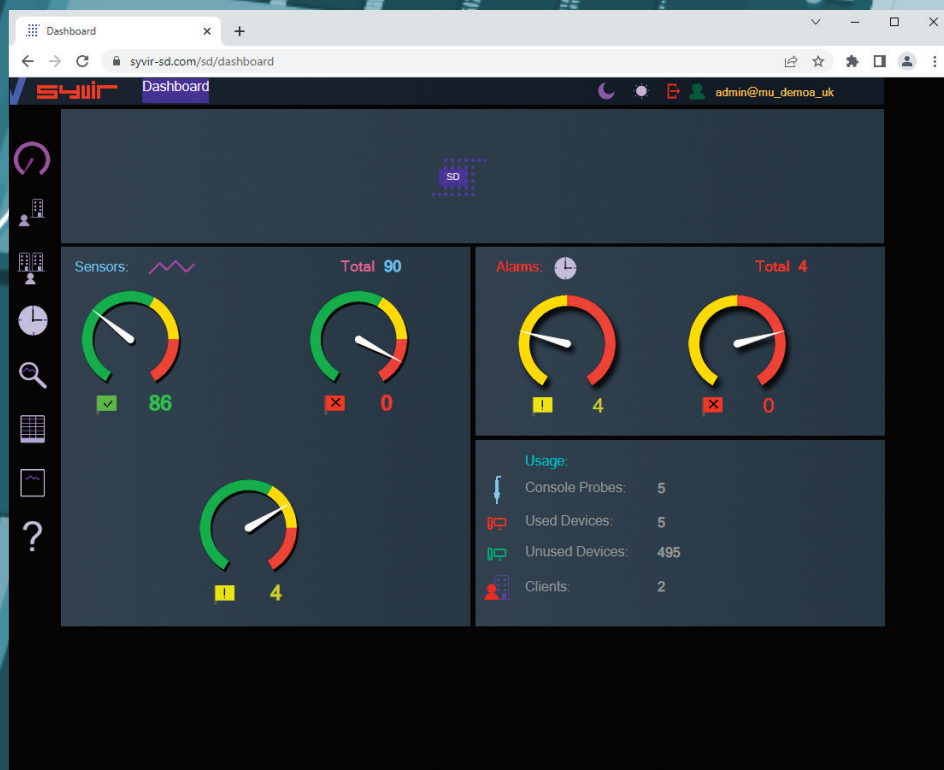

Set the timezone for where you live.

We recommend Google Chrome and Microsoft Edge browsers.

Click on the login icon to visit the login page.

Type in your credentials that were issued to you in your welcome email.

Only administrator accounts have full access to web interface.

The starting point for any web based monitoring session is the dashboard page. This gives a quick at a glance view of the last known statuses of sensors probes and alarms. SD stores in the cloud the last known values from your network. The five sensor dials cover the various states of the sensors.

Probe diagnostic sensors

UP

The sensors channels are all functioning ok.

WARNING

A problem has been detected in one of the sensors channel(s).

DOWN

A serious issue has been detected in one of the sensors channel(s).

NOT DETECTED

Not detected in some cases SD will not be able to retrieve WMI data for a given sensor. Sometimes WMI data is not available for hardware devices. It can vary from each computer vendor what WMI data is available.

In a lot of situations WMI data can be retrieved with a sensor but the data for the sensors requirements is missing...

A windows based program that connects to the SD server. Each monitored endpoint has its own Probe. This is designated by the computer name. The hierarchical structure of SD places the probe as the most powerful item in a pc deployment.

Probe status

UP

The probe is functioning ok.

DOWN

The probe is either not running or the endpoint that the probe is on has been switched off.

Internet

Data is transferred to the SD server using HTTPS, a constant internet connection is required to transfer data.

Delete probe

From the probe directory view open the User hierarchical structure to list Probes on your clients network connected to the SD cloud.

Select the probe you wish to delete.

Click on the delete probe icon.

All data will be deleted along with the sensors attached to the probe.

The probe contains Sensors that use WMI technology to monitor the current state of hardware. Sensors are deployed to monitor clients hardware. Sensors contain channels for multiple items i.e. several drives etc. Diagnostic data is received for each channel that's in use with a deployed sensor. The sensor contains multiple channels.

Sensor Status values

UP

The sensors channels are all functioning ok.

WARNING

A problem has been detected in one of the sensors channel(s).

DOWN

A serious issue has been detected in one of the sensors channel(s). This will trigger an alarm.

NOT DETECTED

On deployment the hardware has not been detected. This could be for a number of reasons. i.e. the hardware doesn't exist on this system. Other reasons for not detected status. In our experience if there is no data there, then no data will appear in the future. In a lot of situations WMI data can be retrieved with a sensor but the data for the sensors requirements is missing... So for some deployments some sensors won't be available.

Alarms are produced when a sensor is set to WARNING or DOWN.

DOWN

WARNING

View the current alarms.

From the client directory view, select the client you wish to view

From the probe directory view open the User hierarchical structure to list alarms on clients network connected to the SD cloud.

Alarms are listed under each probe.

Clear Alarms

Clear Alarm:

Select clear alarm and then the

update icon. This clears the alarm.

Alarm Diagnostics.

38

Alarm diagnostics
Click on the Diagnostics tab.

Click on Probe Diagnostics to view the last status of the deployed sensors on that probe.

Channel Properties: Channel 0

Name: intel(r) q45/q43 express chipset (microsoft corporation - wddm 1.1)
Status : OK

Click on the channel icons to retrieve diagnostic data for the particular channel. In some instances data can be basic.

In most instances you should be able to retrieve the Status of the Channel.

Usually this is a generic message of "OK"

39

Sensors dials are color coded to reflect the status of the sensor.

Green = UP.

Where a problem has been detected by the sensor, the dial will indicate

Yellow = Warning.

A dial that indicates **Red = Down.**

Click on a sensor to view channel data for the particular component.

In the system box is a generic pc view, Sensor channels are mapped to the hardware.

Each channel has properties. Depending on the sensor. These are the main properties...some sensors will use all of the properties, other sensors will just use one or two properties.

Status

Returns the status on the selected component.

Status Info

Returns the status info on the selected component.

Availability

Returns the availability of the current component.

ConfigManagerErrorCode

Returns the ConfigManagerErrorCode of the current component.

Error Description

Details any error message on the current component.

Last Error Code

Returns the last error code of the current component.

Cooling

BIOS

CPU

PC, Server, VMware, Hyper-V Diagnostics.**Select the Diagnostics page .**

Each time a console probe scans the machine, diagnostic data is retrieved for the purpose of pinpointing more accurately where a problem exists.

From the client directory view, select the client you wish to view.

User: admin@mu_demoa_uk

From the probe directory view open the User hierarchical structure to list Console Probes created on the SYVIR SD cloud. Select the Console probe you wish to view.

User: admin@mu_demoa_uk

Battery Diagnostics

Sensor id: 1122

Monitors a battery connected to the endpoint.

BIOS Diagnostics

Sensor id: 1123

Monitors the endpoints basic input/output services (BIOS) that is installed.

Cache Memory Diagnostics

Sensor id: 1109

Monitors Cache Memory on the endpoint running Windows.

CPU Diagnostics

Sensor id: 1121

Monitors a CPU running a Windows operating system.

DMA Diagnostics

Sensor id: 1114

Monitors DMA as seen by the endpoint running the Windows operating system.

Fixed Drive Diagnostics

Sensor id: 1125

Monitors a physical disk drive as seen by the endpoint running the Windows operating system.

 PC, Server, Hyper-V, VMware.

CD/DVD Diagnostics

Sensor id: 1124

Monitors a CD-ROM/DVD drive on a endpoint running Windows

 PC, Server, Hyper-V, VMware.

Ethernet Diagnostics

Sensor id: 1126

Monitors the network adapters on a endpoint running a Windows operating system.

 PC, Server.

Fan Diagnostics

Sensor id: 1127

Monitors endpoint fan diagnostics.

 PC, Server, VMware.

FireWire Diagnostics

Sensor id: 1150

Monitors the endpoints FireWire diagnostics.

 PC, Server.

Heat Pipe Diagnostics

Sensor id: 1129

Monitors the endpoints heat pipe cooling device.

 PC, Server, Hyper-V, VMware.

Keyboard Diagnostics

Sensor id: 1131

Monitors the keyboards installed on the endpoint running Windows.

PC, Server, Hyper-V, VMware.

E-IDE/SATA Diagnostics

Sensor id: 1151

Monitors a integrated device electronics (E-IDE) or SATA controller device.

IR PC, Server.

InfraRed Diagnostics

Sensor id: 1152

Monitors an infrared device.

PC, Server, Hyper-V, VMware.

Motherboard Diagnostics

Sensor id: 1134

Monitors a motherboard that contains the central components of a Windows endpoint.

PC, Server.

Desktop Monitor Diagnostics

Sensor id: 1147

Desktop Monitor Diagnostics...

PC, Server.

Parallel Diagnostics

Sensor id: 1136

Monitors parallel ports on a endpoint running Windows.

PC, Server, VMware.

PCI Diagnostics

Sensor id: 1137

Monitors PCI physical connection points including ports, motherboard slots and peripherals, and proprietary connection points.

 PC, Server.

PCMCIA Diagnostics

Sensor id: 1138

Monitors Personal Computer Memory Card Interface Adapter (PCMCIA of a PC Card) controller device.

 PC, Server, Hyper-V, VMware.

PC Pointing Diagnostics

Sensor id: 1139

Monitors input device used to point to and select regions on the display of an endpoint running Windows. Any device used to manipulate a pointer, or point to the display on an endpoint running Windows.

 PC, Server, Hyper-V, VMware.

Power Diagnostics

Sensor id: 1159

Monitors the power supply state.

 PC, Server.

Refrigeration Diagnostics

Sensor id: 1140

Monitors Refrigeration.

 PC, Server, Hyper-V, VMware.

SCSI Diagnostics

Sensor id: 1141

Monitors SCSI on Windows.

 PC, Server, Hyper-V.

Serial Diagnostics

Sensor id: 1142

Monitors serial ports on an endpoint running Windows.

PC, Server, Hyper-V.

SMBIOS Diagnostics

Sensor id: 1110

Monitors SMBIOS on a endpoint running Windows.

PC, Server.

Sound Diagnostics

Sensor id: 1143

Monitors sound devices on a endpoint running Windows.

PC, Server, VMware.

System Memory Diagnostics

Sensor id: 1133

Monitors a physical memory device located on the endpoint and available to the operating system.

PC, Server.

Temperature Diagnostics

Sensor id: 1145

Monitors temperature sensors on a endpoint motherboard running Windows.

PC, Server.

USB Diagnostics

Sensor id: 1146

Monitors universal serial bus (USB) hub.

PC, Server, Hyper-V, VMware.

Video Diagnostics

Sensor id: 1153

Monitors video controllers on a endpoint running Windows.

PC, Server.

Voltage Diagnostics

Sensor id: 1112

Monitors endpoint Voltage probes on a endpoint running Windows.

PC, Server.

Wireless Diagnostics

Sensor id: 1154

Monitors wireless diagnostics.

Properties

Each channel has properties. Depending on the sensor. These are the main properties...some sensors will use all of the properties, other sensors will just use one or two properties.

Status

Returns the status on the selected component.

Status Info

Returns the status info on the selected component.

Availability

Returns the availability of the current component.

ConfigManagerErrorCode

Returns the ConfigManagerErrorCode of the current component.

Error Description

Details any error message on the current component.

Last Error Code

Returns the last error code of the current component.

Channels

All these properties are mapped from WMI codes. A hierarchical algorithm based on these properties determine a channels status i.e if its up, warning or down.
